

Speed Gate

Speed gates are arranged in lanes. At least two units are required to create a barrier. When authorised identification is shown the barrier automatically opens to allow passage. Mechanisms vary but swinging or retractable sliding panels are most common.

Pros

High flow rate
(up to 60 people per minute)

Highly customisable finish in terms of material and colour

Wide range of casework models

Reasonably small footprint

Optimal combination of security, footprint and throughput

Cons

Strong detection capability but not as good as security revolving doors or security booths

Limited physical security to prevent forced entry

Not designed for bullet or manual attack resistance
